(54) Title: OXADIAZOLE BENZENESULFONAMIDES AS SELECTIVE β_3 AGONISTS FOR THE TREATMENT OF DIABETES AND OBESITY (57) Abstract Oxadiazole substituted benzenesulfonamides are selective β_3 adrenergic receptor agonists with very little β_1 and β_2 adrenergic receptor activity and as such the compounds are capable of increasing lipolysis and energy expenditure in cells. The compounds thus have potent activity in the treatment of Type II diabetes and obesity. The compounds can also be used to lower triglyceride levels and cholesterol levels or raise high density lipoprotein levels or to decrease gut motility. In addition, the compounds can be used to reduce neurogenic inflammation or as antidepressant agents. The compounds are prepared by coupling an aminoalkylphenyl-sulfonamide with an appropriately substituted epoxide. Compositions and methods for the use of the compounds in the treatment of diabetes and obesity and for lowering triglyceride levels and cholesterol levels or raising high density lipoprotein levels or for increasing gut motility are also disclosed.

TITLE OF THE INVENTION

OXADIAZOLE BENZENESULFONAMIDES AS SELECTIVE
 β_3 AGONISTS FOR THE TREATMENT OF DIABETES AND
OBESITY

5

CROSS REFERENCE TO RELATED APPLICATIONS

This application is based on, and claims priority from,
provisional application 60/019,295 filed on June 7, 1996.

10 BACKGROUND OF THE INVENTION

β -Adrenoceptors have been subclassified as β_1 and β_2
since 1967. Increased heart rate is the primary consequence of β_1 -
receptor stimulation, while bronchodilation and smooth muscle
relaxation typically result from β_2 stimulation. Adipocyte lipolysis
15 was initially thought to be solely a β_1 -mediated process. However,
more recent results indicate that the receptor-mediating lipolysis is
atypical in nature. These atypical receptors, later called β_3 -
adrenoceptors, are found on the cell surface of both white and
brown adipocytes where their stimulation promotes both lipolysis
20 (breakdown of fat) and energy expenditure.

Early developments in this area produced compounds
with greater agonist activity for the stimulation of lipolysis (β_3
activity) than for stimulation of atrial rate (β_1) and tracheal
relaxation (β_2). These early developments disclosed in Ainsworth
25 et al., U.S. Patents 4,478,849 and 4,396,627, were derivatives of
phenylethanolamines.

Such selectivity for β_3 -adrenoceptors could make
compounds of this type potentially useful as antiobesity agents. In
addition, these compounds have been reported to show
30 antihyperglycemic effects in animal models of non-insulin-
dependent diabetes mellitus.

A major drawback in treatment of chronic diseases
with β_3 agonists is the potential for stimulation of other β -receptors
and subsequent side effects. The most likely of these include

- 2 -

muscle tremor (β_2) and increased heart rate (β_1). Although these phenylethanolamine derivatives do possess some β_3 selectivity, side effects of this type have been observed in human volunteers. It is reasonable to expect that these side effects resulted from
5 partial β_1 and/or β_2 agonism.

More recent developments in this area are disclosed in Ainsworth *et al.*, U.S. Patent 5,153,210, Caulkett *et al.*, U.S. Patent 4,999,377, Alig *et al.*, U.S. Patent 5,017,619, Lecount *et al.*, European Patent 427480 and Bloom *et al.*, European Patent
10 455006.

Even though these more recent developments purport to describe compounds with greater β_3 selectivity over the β_1 and β_2 activities, this selectivity was determined using rodents, in particular, rats as the test animal. Because even the most highly
15 selective compounds, as determined by these assays, still show signs of side effects due to residual β_1 and β_2 agonist activity when the compounds are tested in humans, it has become apparent that the rodent is not a good model for predicting human β_3 selectivity.

20 Recently, assays have been developed which more accurately predict the effects that can be expected in humans. These assays utilize cloned human β_3 receptors which have been expressed in Chinese hamster ovary cells. See Emorine *et al*, *Science*, 1989, 245:1118-1121; and Liggett, *Mol. Pharmacol.*,
25 1992, 42:634-637. The agonist and antagonist effects of the various compounds on the cultivated cells provide an indication of the antiobesity and antidiabetic effects of the compounds in humans.

PCT Application WO95/29159 published November 2, 1995 (US Patent 5,561,142) discloses selective β_3 agonists of the formula

Compounds of the present invention represent a novel selection within the disclosure of WO95/29159.

SUMMARY OF THE INVENTION

The instant invention is concerned with oxadiazole substituted benzenesulfonamides which are useful as antiobesity and antidiabetic compounds. Thus, it is an object of this invention to describe such compounds. It is a further object to describe the specific preferred stereoisomers of the substituted sulfonamides. A still further object is to describe processes for the preparation of such compounds. Another object is to describe methods and compositions which use the compounds as the active ingredient thereof. Further objects will become apparent from reading the following description.

DESCRIPTION OF THE INVENTION

The present invention provides compounds having the formula I:

- 4 -

wherein

X is

5

- (1) a bond,
- (2) C₁-C₃ alkylene optionally substituted with 1 or 2 groups selected from methyl, C₁-C₅ alkoxy, hydroxy, and halogen,
- (3) C₁-C₃ alkylene optionally substituted with 1 or 2 groups selected from methyl, C₁-C₅ alkoxy, hydroxy, and halogen, wherein said alkylene contains up to two groups selected from Q and carbonyl,
- (4) carbonyl, or
- (5) Q;

10

m is

15

A is

- (1) phenyl,
- (2) a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen,
- (3) a benzene ring fused to a C₅-C₁₀ carbocyclic ring,
- (4) a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen fused to a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen, or
- (5) a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen fused to a C₅-C₁₀ carbocyclic ring;

20

25

- 5 -

- R¹ is
- (1) C₁-C₁₀ alkyl optionally substituted with up to 5 groups selected from
 - (a) hydroxy,
 - (b) halogen,
 - (c) cyano,
 - (d) QR²,
 - (e) C₃-C₈ cycloalkyl,
 - (f) A optionally substituted with up to 5 groups selected from halogen, C₁-C₁₀ alkyl and C₁-C₁₀ alkoxy,
 - (g) Q'COR³,
 - (h) S(O)_nR³, where n is 0 to 2,
 - (i) NR²SO₂R³,
 - (j) NR²CO₂R², and
 - (k) CO₂R²,
 - (2) C₃-C₈ cycloalkyl,
 - (3) oxo,
 - (4) halogen,
 - (5) cyano,
 - (6) QR²,
 - (7) S(O)_nR³, where n is 0 to 2,,
 - (8) Q'COR³,
 - (9) NR²SO₂R³,
 - (10) NR²CO₂R²,
 - (11) A optionally substituted with up to 5 groups independently selected from
 - (a) R²,
 - (b) QR²,
 - (c) halogen, and
 - (d) oxo; or
 - (12) CO₂R²;
- R² is
- (1) hydrogen,
 - (2) C₁-C₁₀ alkyl optionally substituted with up to 5 groups selected from

- 6 -

- 5 (a) hydroxy,
 (b) halogen,
 (c) CO_2R^4 ,
 (d) $\text{S}(\text{O})_n\text{-C}_1\text{-C}_{10}$ alkyl, where n is 0 to 2,
 (e) $\text{C}_3\text{-C}_8$ cycloalkyl,
 (f) $\text{C}_1\text{-C}_{10}$ alkoxy, and
 (g) A optionally substituted with up to 5 groups selected from halogen, $\text{C}_1\text{-C}_{10}$ alkyl and $\text{C}_1\text{-C}_{10}$ alkoxy,
- 10 (3) $\text{C}_3\text{-C}_8$ cycloalkyl, or
 (4) A optionally substituted with up to 5 groups selected from
- 15 (a) halogen,
 (b) nitro,
 (c) oxo,
 (d) NR^4R^4 ,
 (e) $\text{C}_1\text{-C}_{10}$ alkoxy,
 (f) $\text{S}(\text{O})_n\text{-C}_1\text{-C}_{10}$ alkyl, where n is 0 to 2,
- and
- 20 (g) $\text{C}_1\text{-C}_{10}$ alkyl optionally substituted with up to 5 groups selected from hydroxy, halogen, CO_2R^4 , $\text{S}(\text{O})_n\text{-C}_1\text{-C}_{10}$ alkyl, where n is 0 to 2, $\text{C}_3\text{-C}_8$ cycloalkyl, $\text{C}_1\text{-C}_{10}$ alkoxy, and A optionally substituted with up to 5 groups selected from halogen, $\text{C}_1\text{-C}_{10}$ alkyl and $\text{C}_1\text{-C}_{10}$ alkoxy;
- 25 R^3 is (1) R^2 or
 (2) NR^2R^2 ;
- R^4 is (1) H, or
 30 (2) $\text{C}_1\text{-C}_{10}$ alkyl;
- Q is (1) $\text{N}(\text{R}^2)$,
 (2) O or
 (3) $\text{S}(\text{O})_n$, and n is 0 to 2;
- Q' is (1) $\text{N}(\text{R}^2)$,

- 7 -

- (2) O or
 (3) a bond; or

a pharmaceutically acceptable salt thereof.

Compounds of the present invention are a novel
 5 selection within the generic structure disclosed in WO95/29159.
 The present compounds are potent and selective β_3 agonists, and
 have improved oral bioavailability in animals.

In one subset of compounds of formula I X is C₁-C₃
 alkylene, optionally substituted with one or two groups selected
 10 from methyl, and halogen. In one embodiment X is -CH₂-,
 CH(CH₃)-, -C(CH₃)₂ or -CH(F)-, and a preferred embodiment is
 where X is -CH₂-.

In another subset X is C₁-C₃ alkylene-O, C₁-C₃
 alkylene-carbonyl or N(R₂), wherein the alkylene is optionally
 15 substituted with one or two groups selected from methyl, and
 halogen. In one embodiment X is -CH₂O- or -C(CH₃)₂O-,
 wherein the point of attachment to the oxadiazole ring is the carbon
 atom and the point of attachment to the A group is the oxygen
 atom; and a preferred embodiment is where X is CH₂O.

20 The oxadiazole ring may be attached to the
 benzenesulfonamide moiety via either the C3 carbon or the C5
 carbon atom. The numbering of the oxadiazole ring is as shown
 below:

25 Accordingly, compounds of formulae Ia and Ib are provided:

Ia

**Ib**

Another subset of compounds of formula I provides compounds wherein A is (1) phenyl, (2) naphthyl, (3) a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen, or (4) a benzene ring fused to a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen.

Another subset of compounds of formula I provides compounds where R^1 is (1) C₁-C₁₀ alkyl optionally substituted with up to 5 groups selected from hydroxy, halogen, cyano, QR^2 , C₃-C₈ cycloalkyl, A optionally substituted with up to 5 groups selected from halogen, C₁-C₁₀ alkyl and C₁-C₁₀ alkoxy, $Q'COR^3$, $S(O)_nR^3$ where n is 0 to 2, $NR^2SO_2R^3$, and $NR^2CO_2R^2$, (2) halogen, (3) QR^2 , (4) $S(O)_nR^3$ where n is 0 to 2, (5) $Q'COR^3$, (6) phenyl optionally substituted with up to 4 groups independently selected from R^2 , QR^2 and halogen, or (7) 5 or 6-membered heterocycle with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen, optionally substituted with up to 4 groups independently selected from oxo, R^2 , QR^2 and halogen.

25 In a preferred embodiment of compounds of formula I, X is CH₂ or CH₂O in which O is attached to A; A is (1) phenyl, (2) naphthyl, (3) a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen, or (4) a benzene ring fused to a 5 or 6-membered heterocyclic ring with

- 9 -

from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen; R¹ is (1) C₁-C₁₀ alkyl optionally substituted with up to 5 groups selected from halogen, cyano, QR², and A optionally substituted with up to 5 groups selected from halogen, C₁-C₁₀ alkyl and C₁-C₁₀ alkoxy, (2) halogen, (3) phenyl optionally substituted with up to 5 groups independently selected from R², QR² and halogen, (4) 5 or 6-membered heterocycle with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen, optionally substituted with up to 4 groups independently selected from R², QR² and halogen, or (5) QR²; R² is (1) C₁-C₁₀ alkyl optionally substituted with up to 5 groups selected from halogen, C₁-C₁₀ alkoxy, and A optionally substituted with up to 5 groups selected from halogen, C₁-C₁₀ alkyl and C₁-C₁₀ alkoxy, (2) A optionally substituted with up to 5 groups selected from halogen, NR⁴R⁴, C₁-C₁₀ alkoxy, C₁-C₁₀ alkylthio, and C₁-C₁₀ alkyl optionally substituted with up to 5 groups selected from halogen, C₃-C₈ cycloalkyl, C₁-C₁₀ alkoxy, and A optionally substituted with up to 5 groups selected from halogen, C₁-C₁₀ alkyl and C₁-C₁₀ alkoxy; Q is N(R²), O or S.

In a more preferred embodiment, X is CH₂ or CH₂O in which O is attached to A; A is (1) phenyl, (2) naphthyl, (3) a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen, or (4) a benzene ring fused to a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen; R¹ is (1) C₁-C₁₀ alkyl optionally substituted with up to 5 groups selected from halogen, and A optionally substituted with up to 5 groups selected from halogen, C₁-C₁₀ alkyl and C₁-C₁₀ alkoxy, (2) halogen, (3) 5 or 6-membered heterocycle with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen, optionally substituted with up to 4 groups selected from halogen, C₁-C₁₀ alkyl and C₁-C₁₀ alkoxy, or (4) QR²; R² is C₁-C₁₀ alkyl, optionally substituted with up to 5 halogen atoms; and Q is O.

Representative antiobesity and antidiabetic compounds of the present invention include the following:

The compounds of the instant invention all have at least one asymmetric center as noted by the asterisk in structural Formula I. Additional asymmetric centers may be present on the molecule. Each such asymmetric center will produce two optical isomers and it is intended that all such optical isomers, as separated, pure or partially purified optical isomers or racemic mixtures thereof, be included within the ambit of the instant invention. In the case of the asymmetric center represented by the asterisk in Formula I, it has been found that the compound in which the hydroxy substituent is above the plane of the structure, as seen in Formula Ic, is more active and thus more preferred over the compound in which the hydroxy substituent is below the plane of the structure.

The following stereospecific structure represents the preferred stereoisomers of the instant invention:

5 Throughout the instant application, the following terms have the indicated meanings:

 "Alkylenes" means $-(CH_2)_p-$ where p is the designated carbon number. Optionally substituted alkylene may have one or two of the hydrogen atoms replaced with the same or different
 10 enumerated substituents. Where the alkylene contains up to two groups selected from Q, and carbonyl, the Q, or carbonyl group may be at either end of the alkylene chain, or it may be embedded within the chain. Examples include $OCH(CH_3)$, $OC(CH_3)_2$, $C(CH_3)_2O$, OCH_2 , CH_2O , $C(O)CH_2$, CH_2OCH_2 , $OC(O)CH_2$,
 15 $OCH_2CH_2C(O)$, OCH_2CH_2O , $OCH_2CH_2C(O)CH_2$, $CH_2CH(OCH_3)CH_2$, $CH(OCH_3)CH_2$, etc.

 The alkyl groups specified above are intended to include those alkyl groups of the designated length in either a straight or branched configuration. Exemplary of such alkyl
 20 groups are methyl, ethyl, propyl, isopropyl, butyl, sec-butyl, tertiary butyl, pentyl, isopentyl, hexyl, isohexyl, and the like.

 The alkoxy groups specified above are intended to include those alkoxy groups of the designated length in either a straight or branched configuration. Exemplary of such alkoxy
 25 groups are methoxy, ethoxy, propoxy, isopropoxy, butoxy, isobutoxy, tertiary butoxy, pentoxy, isopentoxy, hexoxy, isohexoxy and the like.

- 22 -

The term "halogen" is intended to include the halogen atoms fluorine, chlorine, bromine and iodine.

The term "carbocyclic ring" is intended to include both aromatic and nonaromatic rings containing only carbon atoms. Thus, a benzene ring fused to a C5-C10 carbocyclic ring, includes naphthyl, tetrahydronaphthyl, indanyl and indenyl. A 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen fused to a C5-C10 carbocyclic ring includes benzene fused to a heterocyclic ring as well as a non-aromatic carbocyclic ring fused to a heterocyclic ring. The carbocyclic ring preferably is C5-C7.

A 5 and 6-membered heterocyclic ring, whether isolated or as a part of a fused ring system, is intended to include aromatic and unsaturated non-aromatic heterocycles; and where the heterocycle is part of a fused ring, at least one of the rings is aromatic. Examples of a 5 or 6-membered ring include pyridyl, pyrimidinyl, pyrrolyl, furyl, thienyl, imidazolyl, thiazolyl, thiadiazolyl, tetrazolyl, oxadiazolyl, oxazolyl, imidazolidinyl, pyrazolyl, isoxazolyl. Examples of a benzene ring fused to a 5 or 6-membered heterocyclic ring include benzothiadiazolyl, indolyl, indolinyl, benzodioxolyl, benzodioxanyl, benzothiophenyl, benzofuranyl, benzimidazolyl, benzoxazinyl, benzisoxazolyl, benzothiazolyl, 2,3-dihydrobenzofuranyl, quinolinyl, benzotriazolyl, benzoxazolyl, 1,2,3,4-tetrahydroisoquinolinyl, 1,2,3,4-tetrahydroquinolinyl. Examples of a 5 or 6-membered heterocyclic ring fused to a 5 or 6-membered heterocyclic ring include purinyl, furopyridine and thienopyridine. Examples of a 5 or 6-membered heterocyclic ring fused to a non-aromatic carbocyclic ring include tetrahydrobenzothiazolyl, 5,6,7,8-tetrahydroquinolinyl, 2,3-cyclopentenopyridyl, 4,5,6,7-tetrahydroindolyl, 5,6,7,8-tetrahydroisoquinolyl, 5,6,7,8-tetrahydroquinoxalinyl.

The preferred values of A are phenyl, naphthyl, benzene ring fused to a 5 or 6-membered heterocyclic ring with

- 23 -

from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen, or heterocycles with from 1 to 4 heteroatoms independently selected from one of oxygen or sulfur, and/or 1 to 4 nitrogen atoms.

The more preferred values of A are phenyl, naphthyl, thienyl, pyridinyl, pyrrolyl, benzothienyl, and 2,3-dihydrobenzofuranyl.

Certain of the above defined terms may occur more than once in the above formula and upon such occurrence each term shall be defined independently of the other; thus for example, NR²R² may represent NH₂, NHCH₃, N(CH₃)CH₂CH₃, and the like.

The following abbreviations are used throughout the specification:

	AcOH	: acetic acid
15	AR	: adrenergic receptor
	Boc/BOC	: tert-butyloxycarbonyl

	THF	: tetrahydrofuran
	TLC	: thin layer chromatography

The compounds (I) of the present invention can be prepared as described in the following schemes. For oxadiazoles Ia

- 24 -

where X is other than Q or Q-C₁-C₃ alkylene, as illustrated in Scheme 1, the protected aniline derivative 1 (See Fisher, et. al., WO9529159-A, Nov. 2, 1995, for the synthesis of this compound.) is treated with a 4-cyanobenzenesulfonyl halide, conveniently the sulfonyl chloride 2, and a base such as pyridine in an anhydrous solvent such as dichloromethane or chloroform for 0.5 to 24 hours at temperatures of -20 to 50°C, preferably 0°C, to provide the sulfonamide 3. Treatment of sulfonamide 3 with hydroxylamine, which may be formed in situ from hydroxylamine hydrochloride and a base such as potassium carbonate, in a solvent such as ethanol at temperatures from 0 °C to 100 °C, conveniently 70-80 °C, provides the corresponding amidoxime 4. The oxadiazole is then formed by methods known in the literature (See, for example, Borg, et. al., J. Org. Chem. **1995**, 60, 3112-3120 and Diana, et. al., J. Med. Chem. **1994**, 37, 2421-2436, and references cited therein). This is conveniently carried out by acylation with an acid halide such as the acid chloride 5 (X = Cl) or an anhydride 5 (X = OCOR) including mixed anhydrides in the presence of base or with an acid 5 (X = OH) and a peptide coupling reagent such as ethyldimethylaminopropylcarbodiimide, followed by heating to effect cyclization in a solvent such as pyridine or diglyme. Removal of the protecting group with, in the case of a tert-butylcarbamate, acid such as trifluoroacetic acid or methanolic hydrogen chloride, provides the oxadiazole Ia. The carboxylic acids or acid derivatives 5 are commercially available, known in the literature, or readily prepared by methods commonly known to those skilled in the art.

In some cases, the product Ia from the reaction described in Scheme 1 may be further modified, for example, by the removal of protecting groups or the manipulation of substituents on R¹. These manipulations may include, but are not limited to, reduction, oxidation, alkylation, acylation, and hydrolysis reactions which are commonly known to those skilled in the art.

SCHEME 1.

5

The method employed in Scheme 1 relies on masking the secondary amine in the final product as an N-Boc derivative.

- 26 -

Alternate protecting groups for this secondary amine, which are readily known to those skilled in the art, may be employed. In addition, the reactions illustrated in Scheme 1 may be carried out on a solid phase support linkage. This approach is illustrated in
5 Schemes 2 and 3. As shown in Scheme 2, aniline derivative 6 is coupled to a solid support such as NovaSyn® TGA resin from Novabiochem (7) by treatment with an activating agent, conveniently 4-nitrophenyl chloroformate in the presence of base such as diisopropylethylamine in a solvent or solvent mixture such
10 as 1:1 tetrahydrofuran / dichloromethane. The hydroxyl group is then protected, conveniently as its triethylsilyl ether using triethylsilyl chloride in the presence of a base such as diisopropylethylamine. The resultant derivative 8 is treated with 4-cyanobenzenesulfonyl halide, conveniently the sulfonyl chloride 2,
15 in the presence of a base such as pyridine, to provide the sulfonamide 9. Treatment of intermediate 9 with hydroxylamine as described above provides the corresponding amidoxime 10.

- 27 -

SCHEME 2.

- 28 -

- 29 -

The oxadiazoles Ia are prepared from intermediate 10 as illustrated in Scheme 3. Treatment of the resin-bound amidoxime with an acid, acid chloride or anhydride 5 as described above, in a solvent such as diglyme with heating, conveniently to 90-110 °C, gives the resin-bound oxadiazole. Cleavage from the resin is effected, in the case of Novasyn TGA resin from Novabiochem, by treatment with acid such as trifluoroacetic acid as a 1:1 mixture with dichloromethane.

SCHEME 3.

For cases where X = NH in Formula Ia, the oxadiazole may be prepared from the corresponding isocyanidedichloride (See for example, Japan Patent 05117255, 1993). As shown in Scheme 4, intermediate 4 is treated with isocyanidedichloride 11 and a base such as DBU. Removal of the Boc protecting group under acidic conditions, for example, with trifluoroacetic acid in

- 30 -

dichloromethane, provides the desired oxadiazoles Ia. The requisite isocyanidedichlorides 11 are known in the literature (for example, Kuhle, Angew. Chem. **1962**, 74, 861-866) or readily prepared by methods known to those skilled in the art.

5

SCHEME 4.

For cases where X contains a sulfur or oxygen directly attached to the oxadiazole ring, compounds Ia may be prepared by reaction of the corresponding thiol or alcohol with an activated oxadiazole. As shown in Scheme 5, the amidoxime 4 is treated with trichloroacetyl chloride in a base such as pyridine followed by heating to provide the corresponding oxadiazole 12. Displacement of the trichloromethyl group with an alcohol or thiol 13 in the presence of a base and subsequent deprotection of the Boc secondary amine with acid such as trifluoroacetic acid gives the desired oxadiazoles Ia.

10

15

SCHEME 5.

In some cases, the product Ia from the reactions described in Schemes 4 and 5 may be further modified, for example, by the removal of protecting groups or the manipulation of substituents on R¹. These manipulations may include, but are not limited to, reduction, oxidation, alkylation, acylation, and hydrolysis reactions which are commonly known to those skilled in the art.

- 32 -

The isomeric oxadiazoles Ib are readily available as illustrated in Scheme 6. Aniline derivative 1 is sulfonylated by treatment with 4-(chlorosulfonyl)benzoic acid (14) in the presence of a base such as pyridine to provide the corresponding
5 sulfonamide 15. The oxadiazole is then formed as described above by treatment of 15 with the appropriate amidoxime 16 in the presence of a peptide coupling reagent such as dicyclohexylcarbodiimide or N-ethyl-N'-dimethylaminopropylcarbodiimide, followed by heating to effect
10 cyclization in a solvent such as pyridine or diglyme. Removal of the protecting group with, in the case of a tert-butylcarbamate, acid such as trifluoroacetic acid or methanolic hydrogen chloride, provides the oxadiazole Ib. The amidoximes 16 are commercially
15 available, known in the literature, or readily prepared by methods commonly known to those skilled in the art. Conveniently, they are prepared from the corresponding nitrile by treatment with hydroxylamine.

In some cases, the product Ib from the reaction described in Scheme 6 may be further modified, for example, by
20 the removal of protecting groups or the manipulation of substituents on R¹. These manipulations may include, but are not limited to, reduction, oxidation, alkylation, acylation, and hydrolysis reactions which are commonly known to those skilled in
the art.

SCHEME 6.

- An alternate approach to compounds **Ib** which involves the coupling of an oxadiazolylbenzenesulfonyl chloride to the aniline intermediate **1** is shown in Scheme 7. Amidoxime **16** is coupled to a protected 4-aminobenzoic acid derivative such as Boc-protected amine **17** using a coupling reagent such as EDC or DCC, followed by heating to effect ring closure. The resultant oxadiazole **18** is treated, in the case of a N-Boc-protected derivative, with trifluoroacetic acid. The resultant aniline is diazotized with, for example, sodium nitrite and then treated with sulfur dioxide and copper(I) chloride to provide the corresponding sulfonyl chloride **19**. Coupling of sulfonyl chloride **19** and aniline

- 34 -

intermediate 1 in the presence of base such as pyridine followed by deprotection with trifluoroacetic acid gives the desired oxadiazoles Ib.

SCHEME 7.

10 Compounds of the general Formula I may be present as pairs of enantiomers or, where there is more than one chiral centers, as mixtures of diastereomers. Enantiomeric pairs may be

- 35 -

separated into individual stereoisomers by conventional means, for example by the use of an optically active acid as a resolving agent. A mixture of diastereomers may be separated into diastereoisomeric pairs of enantiomers by, for example, fractional
5 crystallization from a suitable solvent, for example methanol or ethyl acetate or a mixture thereof. The pair of enantiomers may be separated as described above

Alternatively, any enantiomer of a compound of the general Formula I may be obtained by stereospecific synthesis
10 using optically pure starting materials of known configuration.

The instant compounds can be isolated in the form of their pharmaceutically acceptable acid addition salts, such as the salts derived from using inorganic and organic acids. Examples of such acids are hydrochloric, nitric, sulfuric, phosphoric, formic,
15 acetic, trifluoroacetic, propionic, maleic, succinic, malonic and the like. In addition, certain compounds containing an acidic function such as a carboxy or tetrazole, can be isolated in the form of their inorganic salt in which the counterion can be selected from sodium, potassium, lithium, calcium, magnesium and the like, as well as
20 from organic bases.

As previously indicated, the compounds of the present invention have valuable pharmacological properties. Thus the present invention also provides a compound of the general Formula I or a pharmaceutically acceptable salt thereof for use as an active
25 therapeutic substance.

The disease diabetes mellitus is characterized by metabolic defects in production and utilization of glucose which result in the failure to maintain appropriate blood sugar levels. The result of these defects is elevated blood glucose or hyperglycemia.
30 Research on the treatment of diabetes has centered on attempts to normalize fasting and postprandial blood glucose levels. Treatments have included parenteral administration of exogenous insulin, oral administration of drugs and dietary therapies.

- 36 -

Two major forms of diabetes mellitus are now recognized. Type I diabetes, or insulin-dependent diabetes, is the result of an absolute deficiency of insulin, the hormone which regulates glucose utilization. Type II diabetes, or insulin-independent diabetes, often occurs in the face of normal, or even elevated levels of insulin and appears to be the result of the inability of tissues to respond appropriately to insulin. Most of the Type II diabetics are also obese.

Compounds of the present invention are capable of stimulating β_3 adrenoceptor mediated lipolysis, and lowering blood glucose levels. Thus, in one aspect, the present invention provides a compound of the general Formula I or a pharmaceutically acceptable salt thereof for use in the treatment of obesity or hyperglycemia (diabetes) in human or non-human animals. In another aspect, the present invention provides a method for the treatment of obesity which comprises administering to an obese patient a therapeutically effective amount of a compound of the general Formula I, or a pharmaceutically acceptable salt thereof. In a further aspect, the present invention provides a method for the treatment of diabetes which comprises administering to a diabetic patient a therapeutically effective amount of a compound of formula I.

In addition the compounds of the present invention lower triglyceride levels and cholesterol levels and raise high density lipoprotein levels and are therefore of use in combatting medical conditions wherein such lowering (and raising) is thought to be beneficial. Thus they may be used in the treatment of hypertriglyceridaemia, hypercholesterolaemia and conditions of low HDL (high density lipoprotein) levels in addition to the treatment of atherosclerotic disease such as of coronary, cerebrovascular and peripheral arteries, cardiovascular disease and related conditions.

Accordingly, in another aspect the present invention provides a method of lowering triglyceride and/or cholesterol levels and/or increasing high density lipoprotein levels which

- 37 -

comprises administering, to a human or a non-human animal in need thereof, a therapeutically effective amount of a compound of the formula (I) or pharmaceutically acceptable salt thereof. In a further aspect the present invention provides a method of treating atherosclerosis which comprises administering, to an animal in need thereof; a therapeutically effective amount of a compound of the formula (I) or pharmaceutically acceptable salt thereof. The compositions are formulated and administered in the same general manner as detailed below for treating diabetes and obesity. They may also contain other active ingredients known for use in the treatment of atherosclerosis and related conditions, for example fibrates such as clofibrate, bezafibrate and gemfibrozil; inhibitors of cholesterol biosynthesis such as HMG-CoA reductase inhibitors for example lovastatin, simvastatin and pravastatin; inhibitors of cholesterol absorption for example beta-sitosterol and (acyl CoA:cholesterol acyltransferase) inhibitors for example melinamide; anion exchange resins for example cholestyramine, colestipol or a dialkylaminoalkyl derivatives of a cross-linked dextran; nicotinyl alcohol, nicotinic acid or a salt thereof; vitamin E; and thyromimetics.

The compounds of the instant invention also have the effect of reducing intestinal motility and thus find utility as aiding in the treatment of various gastrointestinal disorders such as irritable bowel syndrome. It has been proposed that the motility of non-sphincteric smooth muscle contraction is mediated by activity at β_3 adrenoreceptors. The availability of a β_3 specific agonist, with little activity at β_1 and β_2 receptors will assist in the pharmacologic control of intestinal motility without concurrent cardiovascular effects. The instant compounds are administered generally as described below with dosages similar to those used for the treatment of diabetes and obesity.

It has also been found unexpectedly that the compounds which act as agonists at β_3 adrenoreceptors may be useful in the treatment of gastrointestinal disorders, especially

- 38 -

peptic ulcerations, esophagitis, gastritis and duodenitis, (including that induced by H. pylori), intestinal ulcerations (including inflammatory bowel disease, ulcerative colitis, Crohn's disease and proctitis) and gastrointestinal ulcerations.

5 In addition, β_3 receptors have been indicated to have an effect on the inhibition of the release of neuropeptides in certain sensory fibers in the lung. As sensory nerves may play an important role in the neurogenic inflammation of airways, including cough, the instant specific β_3 agonists may be useful in
10 the treatment of neurogenetic inflammation, such as asthma, with minimal effects on the cardio-pulmonary system.

β_3 adrenoreceptors are also able to produce selective antidepressant effects by stimulating the β_3 receptors in the brain and thus an additional contemplated utility of the compounds of
15 this invention are as antidepressant agents.

 The active compounds of the present invention may be orally administered as a pharmaceutical composition, for example, with an inert diluent, or with an assimilable edible carrier, or they may be enclosed in hard or soft shell capsules, or they may be
20 compressed into tablets, or they may be incorporated directly with the food of the diet. For oral therapeutic administration, which includes sublingual administration, these active compounds may be incorporated with excipients and used in the form of tablets, pills, capsules, ampules, sachets, elixirs, suspensions, syrups, and the
25 like. Such compositions and preparations should contain at least 0.1 percent of active compound. The percentage of active compound in these compositions may, of course, be varied and may conveniently be between about 2 percent to about 60 percent of the weight of the unit. The amount of active compound in such
30 therapeutically useful compositions is such that an effective dosage will be obtained. The active compounds can also be administered intranasally as, for example, liquid drops or spray.

 The effective dosage of active ingredient employed may vary depending on the particular compound employed, the

- 39 -

mode of administration, the condition being treated and the severity of the condition being treated.

When treating diabetes mellitus and/or hyperglycemia generally satisfactory results are obtained when the compounds of the present invention are administered at a daily dosage of from
5 about 0.001 milligram to about 100 milligram per kilogram of animal body weight, preferably given in a single dose or in divided doses two to six times a day, or in sustained release form. In the case of a 70 kg adult human, the total daily dose will generally be
10 from about 0.07 milligrams to about 350 milligrams. This dosage regimen may be adjusted to provide the optimal therapeutic response.

When treating obesity, in conjunction with diabetes and/or hyperglycemia, or alone, generally satisfactory results are
15 obtained when the compounds of the present invention are administered at a daily dosage of from 0.01 milligram to about 100 milligrams per kilogram of animal body weight, preferably given in a single dose or in divided doses two to six times a day, or in sustained release form. In the case of a 70 kg adult human, the
20 total daily dose will generally be from about 0.7 milligrams to about 3500 milligrams. This dosage regimen may be adjusted to provide the optimal therapeutic response.

The tablets, pills, capsules, and the like may also contain a binder such as gum tragacanth, acacia, corn starch or
25 gelatin; excipients such as dicalcium phosphate; a disintegrating agent such as corn starch, potato starch, alginic acid; a lubricant such as magnesium stearate; and a sweetening agent such as sucrose, lactose or saccharin. When a dosage unit form is a capsule, it may contain, in addition to materials of the above type, a
30 liquid carrier such as a fatty oil.

Various other materials may be present as coatings or to modify the physical form of the dosage unit. For instance, tablets may be coated with shellac, sugar or both. A syrup or elixir may contain, in addition to the active ingredient, sucrose as a

- 40 -

sweetening agent, methyl and propylparabens as preservatives, a dye and a flavoring such as cherry or orange flavor.

These active compounds may also be administered parenterally. Solutions or suspensions of these active compounds
5 can be prepared in water suitably mixed with a surfactant such as hydroxy-propylcellulose. Dispersions can also be prepared in glycerol, liquid polyethylene glycols and mixtures thereof in oils. Under ordinary conditions of storage and use, these preparations contain a preservative to prevent the growth of microorganisms.

10 The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions. In all cases, the form must be sterile and must be fluid to the extent that easy syringability exists. It must be stable under
15 the conditions of manufacture and storage and must be preserved against the contaminating action of microorganisms such as bacteria and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol, polyol (e.g. glycerol, propylene glycol and liquid polyethylene glycol), suitable
20 mixtures thereof, and vegetable oils.

The following in vitro assays are suitable for screening compounds that have selective β_3 agonist activity:

Functional Assay: cAMP production in response to ligand is measured according to Barton et al (1991, Agonist-induced
25 desensitization of D2 dopamine receptors in human Y-79 retinoblastoma cells. Mol. Pharmacol. v3229:650-658) modified as follows. CHO cells, stably transfected with the cloned β -adrenergic receptor (β_1 , β_2 or β_3) are harvested after 3 days of subculturing. Harvesting is done with Enzyme-free Dissociation Media (Specialty Media). Cells are counted
30 and distributed in the assay tubes, after being resuspended in Tris buffer (ACC buffer: 75 mM Tris, pH 7.4, 250 mM Sucrose, 12.5 mM $MgCl_2$, 1.5 mM EDTA, 0.2 mM Sodium Metabisulfite, 0.6mM IBMX) containing an antioxidant and a phosphodiesterase inhibitor. Reaction is initiated by mixing 200,000 cells in 100 μ L with 20 μ L of a 6x stock of

- 41 -

ligand/unknown to be tested. Tubes shake at 275 rpm for 45 min at room temperature. The reaction is stopped by boiling the tubes for 3 min. The cell lysate is diluted 5-fold in 0.1 N HCl and then acetylated by the mixture of 150 μ L of acid-diluted sample with 6 μ L of
5 acetylation mixture (acetic anhydride/triethylamine, 1:2.5). The cAMP produced in response to the ligand is measured in the lysate by competing against 125 I-cAMP for binding to a 125 I-cAMP-directed antibody using an automated RIA machine (ATTOFLO, Atto Instruments, Baltimore, MD, Brooker et al 1979, Radioimmunoassay of
10 Cyclic AMP and Cyclic GMP. Advances in Cyclic Nucleotide Research. vol 10: 1-32.). The unknown cAMP level is determined by comparing levels to a standard curve. Alternatively, cAMP is measured using the cAMP SPA kit (code number RPA 556) from Amersham according to the manufacturer's instructions. Samples tested with the latter method
15 do not need to be acetylated.

The non-selective, full agonist β -adrenergic ligand isoproterenol is used at all three receptors to determine maximal stimulation. The human β_3 AR-selective ligand (S)-N-[4-[2-[[2-hydroxy-3-(4-hydroxyphenoxy)propyl]amino]ethyl]-phenyl]-4-
20 iodobenzenesulfonamide is used as a control in all assays. Isoproterenol is titrated at a final concentration in the assay of 10^{-10} M to 10^{-5} M for the β_3 AR and 10^{-11} M to 10^{-6} M for the β_1 AR and β_2 AR assays. L-742,791 is titrated at the β_3 receptor at concentration of 10^{-11} M to 10^{-6} M. At the β_1 AR the concentrations used are 10^{-8} M, 10^{-7} M, 3×10^{-7}
25 M, 10^{-6} M, 3×10^{-6} M and 10^{-5} M. For the β_2 AR a single concentration of 10^{-5} M is used.

Unknown ligands are initially tested at the β_3 AR at a final concentration in the assay of 10^{-7} M. Compounds that have an activation at this concentration equal to or greater than 35% of the
30 isoproterenol stimulation are titrated at the β_3 AR at concentrations equal to those used to titrate the control (S)-N-[4-[2-[[2-hydroxy-3-(4-hydroxyphenoxy)propyl]amino]ethyl]-phenyl]-4-iodobenzenesulfonamide to determine the EC₅₀. The EC₅₀ is defined as the concentration of compound that gives 50% activation of its own

- 42 -

maximum. Data are analyzed using the Prism program (GraphPan, San Diego, CA).

5 A selective compound is defined as a compound with a $(EC_{50} \beta_3 AR)/(IC_{50} \beta_1 AR, \beta_2 AR)$ greater than 100. IC_{50} is defined in the next section. Selective compounds are tested for agonist activity at the $\beta_1 AR$ and the $\beta_2 AR$ by assaying first at a single concentration, $10^{-5} M$. Compounds with activations of less than 20% when compared to the isoproterenol control ($\beta_1 AR$ and $\beta_2 AR$) are retested at $10^{-7} M$ and $10^{-5} M$. Compounds with activations between 20% and 40% and
10 other compounds of interest are titrated at the following concentrations: $10^{-8} M$, $10^{-7} M$, $10^{-6} M$, $3 \times 10^{-6} M$, $10^{-5} M$ and $3 \times 10^{-5} M$. Compounds with activities greater than 40% are not tested further.

Binding Assay: Compounds are also assayed at the β_1 and β_2 receptors to determine selectivity. This is done for all compounds
15 using a 6 point binding assay as follows: CHO cells expressing the β_1 and the β_2 receptors are grown for 3-4 days after splitting. The attached cells are washed with PBS and lysed in 1mM Tris, pH 7.2 for 10 minutes in ice. The flasks are scraped and the membranes centrifuged at $38,000 \times g$ for 15 minutes at $4^\circ C$. The membranes are resuspended in
20 TME buffer (75 mM Tris, pH 7.4, 12.5 mM $MgCl_2$, 1.5 mM EDTA) at a concentration of 1 mg protein/ml. Large batches of membranes can be prepared, aliquoted and stored at $-70^\circ C$ for up to a year without loss of potency. The binding assay is performed by incubating together membranes (20-50 μg of protein), the radiolabelled tracer ^{125}I -
25 cyanopindolol (^{125}I -CYP, 45pM), and the test compounds at final concentrations ranging from $10^{-10} M$ to $10^{-5} M$ in a final volume of 250 μL of TME buffer. The tubes are incubated for 1 hour with shaking at room temperature and the samples are filtered in an IMSCO 96-well cell harvester. The filters are counted in a Gamma counter and the data are
30 analyzed using a 4 parameter fit routine in RS1 (program developed in house using well documented statistical analysis programs) to determine the IC_{50} . The IC_{50} is defined as the concentration of the compound capable of inhibiting 50% of the binding of the radiolabelled tracer (^{125}I -CYP). Compounds having >100 fold selectivity are also tested

- 43 -

for agonist activity at the $\beta 1$ and $\beta 2$ receptors following the protocols already described for the $\beta 3$ AR above.

The following examples are provided so that the invention might be more fully understood. They should not be construed as limiting the invention in any way.

EXAMPLE 1

(R)-N-[4-[2-[N-(1,1-Dimethylethoxycarbonyl)-N-[2-hydroxy-2-(pyridin-3-yl)ethyl]amino]ethyl]phenyl]-4-cyanobenzenesulfonamide

To a solution of 2.18 mmol of (R)-N-[2-[4-(aminophenyl)]ethyl]-2-hydroxy-2-(pyrid-3-yl)ethylcarbamic acid 1,1-dimethylethyl ester (See Fisher, et. al., WO9529159-A, Nov. 2, 1995, for the synthesis of this compound.) in 10 mL of methylene chloride at room temperature was added 160 μ L of pyridine followed by 450 mg of 4-cyanobenzenesulfonyl chloride. The resultant mixture was stirred overnight. TLC (acetone 25%, methylene chloride 75%) on silica indicated the formation of a major fast moving (rf 0.48) spot. Purification by flash chromatography gave 716 mg of the title compound as a white solid: ^1H NMR (400 MHz, CDCl_3) δ 8.53-8.44(m, 2H), 7.78 and 8.67 each (d, $J=8.7$ Hz, 2H), 7.3(m, 1H), 7.1-6.9(m, 4H), 4.8(m, 1H), 3.5-2.6(m, 6H), 1.42(s, 9H).

(R)-N-[4-[2-[N-(1,1-Dimethylethoxycarbonyl)-N-[2-hydroxy-2-(pyridin-3-yl)ethyl]amino]ethyl]phenyl]-4-(aminooximidomethyl)benzenesulfonamide

- 5 Fifteen g of finely ground K₂CO₃ was suspended in 150 mL of absolute ethanol and after about 1 hr. 9 g of the nitrile from Example 1 and 6 g of hydroxylamine hydrochloride were added and stirred under reflux for 16 hr. The reaction mixture was cooled to room temperature and treated with 150 mL of methylene
- 10 chloride and filtered through a bed of silica (30g). The silica was washed with 200 mL of 20% methanol/methylene chloride, and the combined filtrate evaporated and dried under vacuum overnight to yield 9 g of the title compound as a white solid: ¹H NMR (400 MHz, CD₃OD) δ 8.50-8.40(m, 2H), 7.93-7.67(m, 5H), 7.40(m, 1H), 7.08-6.96(m, 4H), 4.84(m, 1H), 3.4-2.6(m, 6H), 1.32 (s, 9H).

- 5 A suspension of 550 mg of the amidoxime from Example 2, 210 mg of EDC, and 160 mg of 4-fluorophenylacetic acid in 7 mL of diglyme was heated (oil bath temp. 110 degrees) while stirring. TLC analysis after 1 h indicated the formation of a new spot more mobile than the amidoxime (rf 0.61, methanol/methylene chloride 7/93). Following overnight heating, this converted to a new more mobile spot (rf 0.72). Purification by flash chromatography on silica and deprotection of the BOC group by treatment with 1:1 TFA/methylene chloride, neutralization with 10% ammonium hydroxide in methanol, and purification by flash chromatography (silica, aqueous ammonium hydroxide, methanol, dichloromethane 1/9/90) gave 305 mg of the title compound: ¹H NMR (400 MHz, CD₃OD) δ 8.51(d, J=2.26Hz, 1H), 8.42-8.40(m, 1H), 8.11(d, J=8.6Hz, 2H), 7.82(d, J=8.6Hz, 2H), 7.79(m, 1H), 7.4-7.37(m, 3H), 7.08 & 7.01(ea. d, J=8.5Hz, ea. 2H), 7.01(m, 2H), 4.78(m, 1H), 4.33(s, 2H), 2.9-2.7(m, 6H).

(R)-N-[4-[2-[[2-Hydroxy-2-(pyridin-3-yl)ethyl]amino]ethyl]phenyl]-4-[5-(3-phenyl)propyl]-[1,2,4]-oxadiazol-3-yl]benzenesulfonamide

The title compound was prepared as described above for Example 3: Selected ^1H NMR Data (400 MHz, CD_3OD) δ 8.10(d, $J=8.62\text{Hz}$, 2H), 7.83(d, $J=8.57\text{Hz}$, 2H), 7.24(m, 1H), 7.16(m, 4H), 2.94(t, $J=7.52\text{Hz}$, 2H), 2.82(m, 2H), 2.14(qn, $J=7.42\text{Hz}$, 2H).

EXAMPLE 10

10

Step A: Preparation of the Resin-Bound Aniline. To 10 g of NovaSyn® TGA resin from Novabiochem in 30 mL of 1:1 tetrahydrofuran/dichloromethane (THF/DCM) was added 4 mL of diisopropylethylamine (DIEA) and 5 g of 4-nitrophenyl chloroformate. The resultant mixture was stirred overnight. The resin was thoroughly washed with THF/DCM until the eluate was colorless, treated with 2 mL of DIEA and 2 g of (R)-N-[2-[4-(aminophenyl)]ethyl]-2-hydroxy-2-(pyrid-3-yl)ethylamine (See Fisher, et. al., WO9529159-A, Nov. 2, 1995, for the synthesis of this compound.) in 20 mL of DMF, and allowed to stir overnight. The resin was washed with DMF, treated with 2 mL of DIEA, 2 mL of triethylsilyl chloride and 10 mL of DMF, and allowed to stir overnight. The resin was then washed successively with 20% aqueous DMF, DMF, THF, iPrOH, ACOH and dichloromethane.

- 50 -

Step B: Preparation of the Resin-Bound

Cyanobenzenesulfonamide. The above resin from Step A was
5 treated with 3 mL of pyridine and 5 g of 4-cyanobenzenesulfonyl
chloride in 30 mL dichloromethane and the reddish suspension was
allowed to stir overnight. The resin was then washed successively
with methanol, AcOH and dichloromethane and a small portion of
the resin was cleaved with 1:1 dichloromethane/TFA and the purity
10 was checked by HPLC.

Step C: Preparation of the Resin-Bound Amidoxime. The resultant cyano compound from Step B was suspended in 50 mL ethanol and treated with 3.6 g of powdered potassium carbonate and 1.8 g of hydroxylamine hydrochloride and stirred at 75 °C for

- 51 -

16 hrs. A small portion was cleaved as above and checked by HPLC, which indicated the presence of the desired amidoxime and the corresponding amide in a 9:1 ratio. The resin was washed as above and used to prepare oxadiazoles as shown below.

5

Step D. Preparation of Resin-Bound Oxadiazoles. A 100-mg portion of the amidoxime resin (0.025 mmole) from Step C and 1 mL diglyme was allowed to swell for 15 min with stirring, and the excess diglyme was drained to the level of the top of resin. To this was added a mixture of 0.25 mmol (10 equiv) of the desired carboxylic acid, 50 mg (0.25 mmol, 10 equiv) of EDC and 1.75 mL of diglyme which had previously been sonicated in a scintillation vial for 20 sec. The tube was covered with a Teflon cover, vented to release excess pressure, and heated on a rack at 99 °C. After 5 minutes, it was vented again. Heating continued for 16 hrs. Diglyme was then drained and the resin was washed successively with DMF, THF/DCM, DCM, and AcOH and dried with a gentle nitrogen blow.

20

- 52 -

Step E. Oxadiazole Final Products. The resin was treated with 1:1 TFA-DCM for 5 minutes. The solvent was drained, and the procedure was repeated. The combined eluants were concentrated to dryness to give the desired oxadiazole as its bistrifluoroacetic acid salt.

Following the procedures outlined for Examples 1-10, the compounds listed in Table 1 were prepared.

EXAMPLE 664-Fluorobenzylamidoxime

- 58 -

To a stirred suspension of hydroxyamine hydrochloride (1.5 g, 3 equiv) and potassium carbonate (4.0 g, 4 equiv) in ~95% aqueous EtOH (15 mL) was added 4-fluorophenylacetonitrile (1.0 g, 7.4 mmol) in one portion. The resulting mixture was stirred at reflux overnight. The reaction was quenched with water, and the aqueous mixture was extracted with EtOAc (3X). The combined organic solution was washed with water and brine, dried with Na₂SO₄, and evaporated. The yellow oil residue was purified by flash column chromatography on silica gel, and eluted with 80-90% EtOAc in hexane. The product (300 mg) was isolated as off-white crystalline solid: ¹H NMR (400 MHz, CDCl₃) δ 3.41 (s, 2H), 4.48 (broad, 2H), 6.98 (m, 2H), 7.21 (m, 2H), 8.8 (very broad, 1H).

15

EXAMPLE 673-(4-Fluorobenzyl)-5-(4-N-tBoc-aminophenyl)-1,2,4-oxadiazole

To a stirred solution of 4-N-tBoc-aminobenzoic acid (425 mg, 1 equiv) in diglyme (3 mL) was added 4-fluorobenzylamidoxime (300 mg, 1.8 mmol) followed by EDC (350 mg, 1 equiv). The reaction was stirred at room temperature overnight, and then heated to 100°C for 3 hr under nitrogen. After cooling, solvent was evaporated and the residue was purified by flash column chromatography on silica gel, and eluted with 1-2% methanol in dichloromethane. The product (150 mg) was isolated as viscous yellow oil: ¹H NMR (400 MHz, CDCl₃) δ 1.50 (s, 9H), 4.06 (s, 2H), 7.0 (m, 2H), 7.3 (m, 2H), 7.48 (d, J=8.8Hz, 2H), 8.00 (d, J=8.8Hz, 2H).

EXAMPLE 683-(4-Fluorobenzyl)-5-(4-chlorosulfonylphenyl)-1,2,4-oxadiazole

To a stirred solution of the above oxadiazole from
5 Example 67 (150 mg, 0.4 mmol) in dichloromethane (2.5 mL) was
added TFA (2.5 mL) in one portion. After 2 hr, solvent and TFA
were evaporated under a stream of nitrogen. The solid residue was
taken up into concentrated hydrochloric acid (4 mL) and glacial
acetic acid (1 mL) with stirring. The resulting mixture was cooled
10 to -10°C, and a solution NaNO₂ (50 mg, 2 equiv) in water (1 mL)
was added dropwise so that the reaction temperature was lower
than -5 °C. After the addition, the orange colored mixture was
stirred for 45 min, and then transferred onto a saturated solution of
SO₂ in glacial AcOH (~4 mL) containing CuCl (100 mg) at 0-10
15 °C. The resulting olive-green mixture foamed during the addition,
and slowly turned yellow. After 40 min. at room temperature, the
reaction was poured onto ice-water, and extracted with EtOAc
(3X). The combined organic solution was washed with cold water,
cold aqueous NaHCO₃, and brine, dried with MgSO₄, and
20 evaporated. The residue was purified by flash column
chromatography on silica gel, and eluted with 25% EtOAc in
hexane. The product (2.5 mg) was isolated as white solid: ¹H
NMR (400 MHz, CDCl₃) δ 4.13 (s, 2H), 7.0 (m, 2H), 7.3 (m, 2H),
8.17 (d, J=8.8Hz, 2H), 8.34 (d, J=8.8Hz, 2H).

(R)-N-[4-[2-[[2-Hydroxy-2-(pyridin-2-yl)ethyl]amino]ethyl]phenyl]-4-[3-(4-fluorobenzyl)-[1,2,4]-oxadiazol-5-yl]benzenesulfonamide

To a stirred solution of the above sulfonyl chloride from Example 68 (2.5 mg, 0.007 mmol) in dichloromethane (1 mL) was added (R)-N-[2-[4-(aminophenyl)]ethyl]-2-hydroxy-2-(pyrid-3-yl)ethylcarbamate 1,1-dimethylethyl ester (3.6 mg, 1.4 equiv) and pyridine (1 drop). The reaction was stirred at room temperature overnight. After removing the solvent under reduced pressure, the residue was purified by flash column chromatography on silica gel, and eluted with EtOAc. The tBoc protecting group was then removed by stirring a dichloromethane solution (1 mL) of the compound with TFA (1 mL) at room temperature for 2 hr. Solvent and TFA were removed by a stream of nitrogen, and the residue was purified by flash column chromatography on silica gel, and eluted with 10% methanol (containing 1/10 aqueous ammonium hydroxide) in dichloromethane. The product (2 mg) was isolated as white solid: ¹H NMR (400 MHz, CD₃OD) δ 2.70-2.90 (m, 6H), 4.12 (s, 2H), 4.82 (m, 1H), 7.05 (m, 6H), 7.3-7.4 (m, 3H), 7.82 (m, 1H), 7.88 (d, J=8.6Hz, 2H), 8.18 (d, J=8.6Hz, 2H), 8.42 (m, 1H), 8.52 (m, 1H).

EXAMPLE 703,4-Difluorobenzylamidoxime

Following the procedure outlined in Example 66, the
 5 title compound was prepared: ^1H NMR (400 MHz, CDCl_3) δ 3.39 (s, 2H), 4.46 (broad, 2H), 7.0 (m, 1H), 7.1 (m, 2H), 7.4 (very broad, 1H).

EXAMPLE 71

(R)-N-[4-[2-[[2-Hydroxy-2-(pyridin-2-yl)ethyl]amino]ethyl]phenyl]-4-[3-(3,4-difluorobenzyl)-[1,2,4]-oxadiazol-5-yl]benzenesulfonamide

To a stirred solution of (R)-N-[2-[4-(aminophenyl)]ethyl]-2-hydroxy-2-(pyrid-3-yl)ethylcarbamic acid 1,1-dimethylethyl ester (500 mg, 1.4 mmol) and pyridine (0.15 mL, 2 equiv) in diglyme (10 mL) was added 4-chlorosulfonyl benzoic acid (310 mg, 1 equiv). The orange red reaction mixture was stirred at room temperature overnight. To this mixture was added the above amidoxime from Example 70 (280 mg, 1.1 equiv) followed by DCC (310 mg, 1.1 equiv), and stirring was continued at room temperature for another day. The reaction was then heated to 100°C for 3 hr. After removing the solvent in vacuo, the residue was purified by flash column chromatography on silica gel, and eluted with EtOAc. The tBoc protecting group was then removed by stirring a dichloromethane solution (2.5 mL) of the compound

with TFA (2.5 mL) at room temperature for 2 hr. Solvent and TFA were removed by a stream of nitrogen, and the crude product was purified by flash column chromatography on silica gel, and eluted with 10% methanol (containing 1/10 aqueous ammonium hydroxide) in dichloromethane. The product (180 mg) was isolated as light yellow solid: ^1H NMR (400 MHz, CD_3OD) δ 2.70-2.90 (m, 6H), 4.13 (s, 2H), 4.8 (m, 1H), 7.0-7.4 (m, 8H), 7.8 (m, 1H), 7.88 (d, $J=8.6\text{Hz}$, 2H), 8.18 (d, $J=8.6\text{Hz}$, 2H), 8.42 (m, 1H), 8.51 (m, 1H).

(R)-N-[4-[2-[[2-Hydroxy-2-(pyridin-3-yl)ethyl]amino]ethyl]phenyl]-4-(5-phenylamino-[1,2,4]-oxadiazol-3-yl)benzenesulfonamide

To a solution of the amidoxime from Example 2 (100 mg, 0.18 mmol) and 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) (30mg, 0.20mmol) in anhydrous dichloromethane (20 ml) under nitrogen at 0 °C, phenylisocyanide dichloride (31 mg, 0.18 mmol) was added slowly. The resulting solution was allowed to stir at 0 °C for 30 min. and then warm to room temperature and stir overnight. The crude product was purified by silica gel prep TLC(8% methanol/dichloromethane, containing 1% aqueous ammonium hydroxide). The resultant Boc derivative was treated with 50% trifluoroacetic acid in dichloromethane and then

75	4-trifluoromethoxyphenoxymethyl, bistrifluoroacetate salt	8.08 (m, 2H), 7.22 (d, 2H), 5.27 (m, 2H), 5.49 (s, 2H)
76	4-trifluoromethoxyphenylmethyl, bistrifluoroacetate salt	8.05 (m, 2H), 7.48 (d, 2H), 5.28 (m, 2H), 4.40 (s, 2H)

EXAMPLE 77

(R)-N-[4-[2-[[2-Hydroxy-2-(pyridin-3-yl)ethyl]amino]ethyl]phenyl]-4-[5-[1-(4-fluorophenyl)-1-methoxymethyl]-[1,2,4]-oxadiazol-3-yl]benzenesulfonamide

Step A. Methyl 4-Fluoromandelate. 4-Fluoromandelic acid (2.53 g) in 10 ml of THF was treated with excess diazomethane etherate (generated from N-methyl-N-nitrosourea and aqueous potassium hydroxide at 0° C). The reaction mixture was concentrated *in vacuo*, and the residue was partitioned between ethyl acetate and saturated aqueous sodium bicarbonate. The title compound (2.70 g) was isolated as an oil after drying and evaporation: Selected ¹H NMR (400 MHz, CDCl₃) δ 3.08 (s, 3H) and 3.75 (s, 3H).

- 66 -

Step B. Methyl (4-Fluorophenyl)methoxyacetate. Sodium hydride (585 mg, 60% oil dispersion) was added in portions to a stirred solution of 2.02 g methyl 4-fluoromandelate obtained above in a mixture of 18 mL of THF and 3 mL of DMF at 0 °C. After 10 min, iodomethane (1.95 mL, 3 equiv) was added and the mixture was allowed to warm up to room temperature and stir for 0.5 h. After evaporation and extraction with ethyl acetate, the organic phase was washed with water and brine, dried over magnesium sulfate, and the residue obtained after filtration and evaporation was purified by flash chromatography on silica column (20% ethyl acetate/hexane), affording 1.01 g of the title compound: ¹H NMR (400 MHz, CDCl₃) δ 7.43-7.37 (m, 2H), 7.08-7.0 (m, 2H), 4.73 (s, 1H), 3.78 (s, 3H), 3.70 (s, 3H).

Step C. (4-Fluorophenyl)methoxyacetic acid. The above methyl ether methyl ester (1.01 g) and 3.67 mL of 2N aqueous sodium hydroxide in 14 mL of methanol at 0 °C was stirred at room temperature for 2 h. The mixture was evaporated, chilled in ice, acidified with 2N aqueous hydrochloric acid, extracted with ethyl acetate, washed with water and brine, and dried with magnesium sulfate. Evaporation yielded the corresponding carboxylic acid (1.0 g): Selected ¹H NMR (400 MHz, CDCl₃) δ 3.70 (s, 3H).

Step D. (R)-N-[4-[2-[N-(1,1-Dimethylethoxycarbonyl)-N-[2-hydroxy-2-(pyridin-3-yl)ethyl]amino]ethyl]phenyl]-4-[5-[1-(4-fluorophenyl)-1-methoxymethyl]-[1,2,4]-oxadiazol-3-

yl]benzenesulfonamide. To a stirred mixture of equimolar molar quantities of the carboxylic acid from Step C (438 mg, 2.38 mmol) and the amidoxime from Example 2 (1.32 g, 2.38 mmol) in 14.3 mL of THF at room temperature under nitrogen was added EDC (456 mg, 2.38 mmol) in portions. The resultant mixture was stirred at ambient temperature for 16 h, and then heated at 50 °C for 1.5 h. The solvent (THF) was removed by evaporation and replaced with an equal volume of dry pyridine. The mixture was refluxed for 5 h, evaporated to an oil and purified by preparative TLC (SiO₂ plates) in 90:9:1 dichloromethane: methanol:aqueous ammonium

hydroxide to give 881 mg of the title compound: ^1H NMR (400 MHz, CDCl_3) δ 8.48 (br s, 2H), 8.11 (d, $J = 8.45$ Hz, 2H), 7.79 (d, $J = 8.45$ Hz, 2H), 7.69 (br s, 1H), 7.51-7.47 (m, 2H), 7.3-7.25 (m, 1H), 7.11-7.02 (m, 2H), 6.96 (br s, 4H), 5.57 (s, 1H), 4.89-4.82 (br s, 1H), 4.63-4.55 (br s, 1H), 3.47 (s, 3H), 3.44-3.06 (m, 4H), 2.83-2.57 (m, 3H), 1.41 (s, 9H).

Step E. (R)-N-[4-[2-[[2-hydroxy-2-(pyridin-3-yl)ethyl]amino]ethyl]phenyl]-4-[5-[1-(4-fluorophenyl)-1-methoxymethyl]-[1,2,4]-oxadiazol-3-yl]benzenesulfonamide. The above N-Boc compound from Step D was deprotected with 24 mL of trifluoroacetic acid in 36 mL of dichloromethane at 0 °C and at ambient temperature overnight. The mixture was evaporated and treated with 1 mL of 10% aqueous ammonium hydroxide in methanol and then the final residue obtained after evaporation was purified by preparative TLC (90:9:1 dichloromethane:methanol:aqueous ammonium hydroxide) to give 670 mg of the title compound: ^1H NMR (400 MHz, CDCl_3) δ 8.51 (br s, 1H), 8.47-8.46 (m, 1H), 8.09 (d, $J = 8.49$ Hz, 2H), 7.80 (d, $J = 8.49$ Hz, 2H), 7.65 (m, 1H), 7.5-7.42 (m, 2H), 7.28-7.20 (m, 1H), 7.10-6.93 (m, 6H), 5.56 & 5.54 (2s, 1H), 5.02 (m, $J = 6.37$ Hz, 1H), 4.8-4.65 (m, 1H), 3.45 & 3.44 (2s, 3H), 3.35-3.26 (m, 2H), 2.9-2.75 (m, 2H), 2.75-2.55 (m, 4H).

Following the procedures outlined for Examples 1-10 and 77, the compounds listed in Table 3 were prepared.

5 (R)-N-[4-[2-[[2-Hydroxy-2-(pyridin-3-yl)ethyl]amino]ethyl]phenyl]-4-[5-[1-fluoro-1-(4-trifluoromethylphenyl)methyl]-[1,2,4]-oxadiazol-3-yl]benzenesulfonamide

10 Step A. Methyl 4-trifluoromethylphenylacetate. A colorless solution of 4-trifluorophenylacetic acid (2.00 g, 9.8 mmol) in methanol (5 mL) containing concentrated H₂SO₄ (0.5 mL) was heated at reflux for 3 h. After cooling to RT, the volume of methanol was reduced *in vacuo*. Ice was added and the mixture extracted with diethyl ether (3X). The combined organic phase was washed with water, saturated NaHCO₃ solution (4X), water, brine,

- 72 -

dried (MgSO₄) and the solvent removed *in vacuo* to leave 1.98 g (93%) of the title compound as a colorless liquid: ¹H NMR (300 MHz, CDCl₃) δ 7.58 (d, J = 8.0 Hz, 2H), 7.40 (d, J = 8.0 Hz, 2H), 3.71 (s, 3H), 3.69 (s, 2H).

5 Step B. Methyl 2-fluoro-2-(4-trifluoromethylphenyl)acetate. A 1.0M solution of lithium bis(trimethylsilyl)amide in THF (1.97 mL, 1.97 mmol) was added to a stirred solution of the ester from Step A (391 mg, 1.79 mmol) in THF (4 mL) at -78 °C. The yellow solution was stirred at -78 °C for 10 min. A precooled solution of
10 N-fluorobenzenesulfonimide (593 mg, 1.88 mmol) in THF (4 mL) was added dropwise via a cannular. The off-white suspension was allowed to warm slowly to RT over 12 h. Saturated NH₄Cl solution was added and the mixture extracted with diethyl ether (3X). The combined organic phase was washed with water (2X), brine, dried
15 (MgSO₄) and the solvent removed *in vacuo*. Flash chromatography (silica, 30% DCM-hexanes) afforded the title compound (270 mg, 64%) as a pale yellow liquid: ¹H NMR (400 MHz, CDCl₃) δ 7.66 (d, J = 8.4 Hz, 2H), 7.59 (d, J = 8.1 Hz, 2H), 5.85 (d, J = 47 Hz, 1H), 3.78 (s, 3H).

20 Step C. 2-Fluoro-2-(4-trifluoromethylphenyl)acetic acid. A solution of the ester from Step B (270 mg, 1.15 mmol) in methanol (10 mL) containing 5N NaOH solution (1 mL) was stirred at RT for 12 h. The volume of methanol was reduced to ~10% *in vacuo*. 5% Citric acid solution was added and the mixture extracted with
25 ethyl acetate (4X). The combined organic phase was washed with water (2X), brine, dried (MgSO₄) and the solvent removed *in vacuo* to leave the title compound (266 mg, 100%) as an off-white solid: ¹H NMR (300 MHz, CD₃OD) δ 7.73 (d, J = 8.5 Hz, 2H), 7.68 (d, J = 8.3 Hz, 2H), 5.99 (d, J = 48 Hz, 1H).

30 Step D. (R)-N-[4-[2-[[2-Hydroxy-2-(pyridin-3-yl)ethyl]amino]ethyl]phenyl]-4-[5-[1-fluoro-1-(4-trifluoromethylphenyl)methyl]-[1,2,4]-oxadiazol-3-yl]benzenesulfonamide. The title compound was prepared as described above for Example 3 using the acid from Step C: ¹H

- 73 -

NMR (400 MHz, CD₃OD) δ 8.51 (d, J = 2.1 Hz, 1H), 8.42 (dd, J = 4.9, 1.6 Hz, 1H), 8.14 (d, J = 8.7 Hz, 2H), 7.84 (d, J = 8.6 Hz, 2H), 7.81 (m, 1H), 7.79 (s, 4H), 7.38 (dd, J = 7.9, 4.9 Hz, 1H), 7.08 (d, J = 8.5 Hz, 2H), 7.02 (d, J = 8.6 Hz, 2H), 4.79 (m, 1H), 2.95-
 5 2.70 (m, 6H).

EXAMPLE 111

10 (R)-N-[4-[2-[[2-Hydroxy-2-(pyridin-3-yl)ethyl]amino]ethyl]phenyl]-4-[5-[1-(4-trifluoromethylphenyl)-1-ethyl]-[1,2,4]-oxadiazol-3-yl]benzenesulfonamide

Step A. Methyl 2-methyl-2-(4-trifluoromethylphenyl)acetate. A 1.0M solution of lithium bis(trimethylsilyl)amide in THF (2.02 mL, 2.02 mmol) was added to a stirred solution of the ester from Example 110, Step A (400 mg, 1.83 mmol) in THF (8 ml) at -78 °C. The solution was stirred at -78 °C for 10 min. Methyl iodide (120 μ L, 1.93 mmol) was added. The solution was allowed to warm slowly to RT over 12 h. Saturated NH₄Cl solution was added and the mixture extracted with diethyl ether (3X). The combined
 15 organic phase was washed with water (2X), brine, dried (MgSO₄) and the solvent removed *in vacuo*. Flash chromatography (silica, 2-3% ethyl acetate-hexanes) afforded the title compound (234 mg, 55%) as a colorless liquid: ¹H NMR (400 MHz, CDCl₃) δ 7.56 (d, J = 8.1 Hz, 2H), 7.40 (d, J = 8.3 Hz, 2H), 3.77 (q, J = 7.1 Hz, 1H),
 20 3.66 (s, 3H), 1.50 (d, J = 7.1 Hz, 3H).

- 74 -

Step B. 2-Methyl-2-(4-trifluoromethylphenyl)acetic acid. A solution of the ester from Step A (234 mg, 1.01 mmol) in methanol (10 mL) containing 5N NaOH solution (1 mL) was stirred at RT for 12 h. The volume of methanol was reduced to ~10% *in vacuo*.

5 5% Citric acid solution was added and the mixture extracted with ethyl acetate (3X). The combined organic phase was washed with water (2X), brine, dried (MgSO₄) and the solvent removed *in vacuo* to leave the title compound (213 mg, 97%) as an off-white solid: ¹H NMR (300 MHz, CD₃OD) δ 7.60 (d, J = 8.5 Hz, 2H),
10 7.45 (d, J = 8.2 Hz, 2H), 3.82 (q, J = 7.1 Hz, 1H), 1.55 (d, J = 7.2 Hz, 3H).

Step C. (R)-N-[4-[2-[[2-Hydroxy-2-(pyridin-3-yl)ethyl]amino]ethyl]phenyl]-4-[5-[1-(4-trifluoromethylphenyl)-1-ethyl]-[1,2,4]-oxadiazol-3-yl]benzenesulfonamide. The title

15 compound was prepared as described above for Example 3 using the acid from Example Step B: ¹H NMR (400 MHz, CD₃OD) δ 8.51 (d, J = 2.1 Hz, 1H), 8.42 (dd, J = 4.9, 1.6 Hz, 1H), 8.14 (d, J = 8.5 Hz, 2H), 7.84 (d, J = 8.6 Hz, 2H), 7.81 (m, 1H), 7.65 (d, J = 8.4 Hz, 2H), 7.55 (d, J = 8.3 Hz, 2H), 7.37 (dd, J = 7.9, 5.0 Hz, 1H),
20 7.08 (d, J = 8.4 Hz, 2H), 7.02 (d, J = 8.6 Hz, 2H), 4.79 (dd, J = 7.6, 5.2 Hz, 1H), 4.66 (q, J = 7.1 Hz, 1H), 2.91-2.68 (m, 6H), 1.79 (d, J = 7.2 Hz, 3H).

Following the procedures outlined for Examples 1-10,
25 77, and 110-111, the compounds listed in Table 4 were prepared.

WHAT IS CLAIMED IS:

1. A compound having the formula I:

wherein

X is

- (1) a bond,
- (2) C₁-C₃ alkylene optionally substituted with 1 or 2 groups selected from methyl, C₁-C₅ alkoxy, hydroxy, and halogen,
- (3) C₁-C₃ alkylene optionally substituted with 1 or 2 groups selected from methyl, C₁-C₅ alkoxy, hydroxy, and halogen, wherein said alkylene contains up to two groups selected from Q and carbonyl,
- (4) carbonyl, or
- (5) Q;

m is

0 to 5;

A is

- (1) phenyl,
- (2) a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen,
- (3) a benzene ring fused to a C₅-C₁₀ carbocyclic ring,
- (4) a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen fused to a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen, or

- 79 -

- R¹ is
- (5) a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen fused to a C₅-C₁₀ carbocyclic ring;
 - (1) C₁-C₁₀ alkyl optionally substituted with up to 5 groups selected from
 - (a) hydroxy,
 - (b) halogen,
 - (c) cyano,
 - (d) QR²,
 - (e) C₃-C₈ cycloalkyl,
 - (f) A optionally substituted with up to 5 groups selected from halogen, C₁-C₁₀ alkyl and C₁-C₁₀ alkoxy,
 - (g) Q'COR³,
 - (h) S(O)_nR³, where n is 0 to 2,
 - (i) NR²SO₂R³,
 - (j) NR²CO₂R², and
 - (k) CO₂R²,
 - (2) C₃-C₈ cycloalkyl,
 - (3) oxo,
 - (4) halogen,
 - (5) cyano,
 - (6) QR²,
 - (7) S(O)_nR³, where n is 0 to 2,,
 - (8) Q'COR³,
 - (9) NR²SO₂R³,
 - (10) NR²CO₂R²,
 - (11) A optionally substituted with up to 5 groups independently selected from
 - (a) R²,
 - (b) QR²,
 - (c) halogen, and
 - (d) oxo; or
 - (12) CO₂R²;

- R^2 is
 - (1) hydrogen,
 - (2) C₁-C₁₀ alkyl optionally substituted with up to 5 groups selected from
 - (a) hydroxy,
 - (b) halogen,
 - (c) CO₂R⁴,
 - (d) S(O)_n-C₁-C₁₀ alkyl, where n is 0 to 2,
 - (e) C₃-C₈ cycloalkyl,
 - (f) C₁-C₁₀ alkoxy, and
 - (g) A optionally substituted with up to 5 groups selected from halogen, C₁-C₁₀ alkyl and C₁-C₁₀ alkoxy,
 - (3) C₃-C₈ cycloalkyl, or
 - (4) A optionally substituted with up to 5 groups selected from
 - (a) halogen,
 - (b) nitro,
 - (c) oxo,
 - (d) NR⁴R⁴,
 - (e) C₁-C₁₀ alkoxy,
 - (f) S(O)_n-C₁-C₁₀ alkyl, where n is 0 to 2,
 and
 - (g) C₁-C₁₀ alkyl optionally substituted with up to 5 groups selected from hydroxy, halogen, CO₂R⁴, S(O)_n-C₁-C₁₀ alkyl, where n is 0 to 2, C₃-C₈ cycloalkyl, C₁-C₁₀ alkoxy, and A optionally substituted with up to 5 groups selected from halogen, C₁-C₁₀ alkyl and C₁-C₁₀ alkoxy;
- R^3 is
 - (1) R^2 or
 - (2) NR²R²;
- R^4 is
 - (1) H, or
 - (2) C₁-C₁₀ alkyl;
- Q is
 - (1) N(R^2),

- 81 -

Q' is

- (2) O or
- (3) S(O)_n, and n is 0 to 2;
- (1) N(R²),
- (2) O or
- (3) a bond; or

a pharmaceutically acceptable salt thereof.

2. A compound of Claim 1 wherein X is C₁-C₃ alkylene optionally substituted with one or two groups selected from methyl, and halogen.

3. A compound of Claim 1 wherein X is C₁-C₃ alkylene-O-, C₁-C₃ alkylene-carbonyl, carbonyl or N(R²) wherein the alkylene is optionally substituted with one or two groups selected from methyl and halogen.

4. A compound of Claim 1 wherein X is selected from the group consisting of -CH₂-, -CH(CH₃)-, -C(CH₃)₂-, -CHF-, -CH₂O-, and -C(CH₃)₂O-.

5. A compound of Claim 1 having the formula Ia:

6. A compound of Claim 1 having the formula Ib:

- 82 -

- 5 A is
7. A compound of Claim 1 wherein
- (1) phenyl,
- (2) naphthyl,
- (3) a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen, or
- 10 (4) a benzene ring fused to a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen.
- 15 R¹ is
8. A compound of Claim 1 wherein
- (1) C₁-C₁₀ alkyl optionally substituted with up to 5 groups selected from
- (a) hydroxy,
- (b) halogen,
- (c) cyano,
- 20 (d) QR²,
- (e) C₃-C₈ cycloalkyl,
- (f) A optionally substituted with up to 5 groups selected from halogen, C₁-C₁₀ alkyl and C₁-C₁₀ alkoxy,
- 25 (g) Q'COR³,
- (h) S(O)_nR³, where n is 0 to 2,
- (i) NR²SO₂R³, and
- (j) NR²CO₂R²,

- 83 -

- (2) halogen,
(3) QR^2 ,
(4) $S(O)_nR^3$, where n is 0 to 2,
(5) $Q'COR^3$,
5 (6) phenyl optionally substituted with up to 4 groups independently selected from
(a) R^2 ,
(b) QR^2 and
(c) halogen, or
10 (7) 5 or 6-membered heterocycle with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen, optionally substituted with up to 4 groups independently selected from
(a) oxo,
15 (b) R^2 ,
(c) QR^2 and
(d) halogen.
9. A compound of Claim 1 wherein
20 A is
(1) phenyl,
(2) naphthyl,
(3) a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen, or
25 (4) a benzene ring fused to a 5 or 6-membered heterocyclic ring with from 1 to 4 heteroatoms selected from oxygen, sulfur and nitrogen;

 CH_2O wherein oxygen is attached to the A moiety.
- 20 X is 14. A compound of Claim 1 wherein
 (1) CH_2
 (2) CH_2O wherein oxygen is attached to the A
 moiety,
 A is (1) phenyl,
 (2) naphthyl,
 25 (3) a 5 or 6-membered heterocyclic ring with from
 1 to 4 heteroatoms selected from oxygen, sulfur and
 nitrogen,
 (4) a benzene ring fused to a 5 or 6-membered
 heterocyclic ring with from 1 to 4 heteroatoms
 30 selected from oxygen, sulfur and nitrogen;
 R¹ is (1) $\text{C}_1\text{-C}_{10}$ alkyl optionally substituted with up to 5

16. A compound of Claim 1 having the formula Ic:

- 100 -

Ic

- 5 17. A method for the treatment of diabetes which comprises administering to a diabetic patient an effective amount of a compound of Claim 1.
- 10 18. A method for the treatment of obesity which comprises administering to an obese patient an effective amount of a compound of Claim 1.
- 15 19. A method for lowering triglyceride levels and cholesterol levels or raising high density lipoprotein levels which comprises administering to a patient needing lower triglyceride and cholesterol levels or higher high density lipoprotein levels an effective amount of a compound of Claim 1.
- 20 20. A method for decreasing gut motility which comprises administering to a patient in need of decreased gut motility, an effective amount of a compound of Claim 1.
- 25 21. A method for reducing neurogenic inflammation of airways which comprises administering to a patient in need of reduced neurogenic inflammation, an effective amount of a compound of Claim 1.

22. A method for reducing depression which comprises administering to a depressed patient an effective amount of a compound of Claim 1.

5 23. A method for treating gastrointestinal disorders which comprises administering to a patient with gastrointestinal disorders an effective amount of a compound of Claim 1.

10 24. A composition for the treatment of diabetes or obesity or for lowering triglyceride or cholesterol levels or increasing high density lipoprotein levels or for decreasing gut motility or for reducing neurogenic inflammation or for treating depression or for treating gastrointestinal disorders which
15 comprises an inert carrier and an effective amount of a compound of Claim 1.

25. A pharmaceutical composition which comprises a compound of Claim 1 and a pharmaceutically acceptable carrier.
